

Battery Installation Procedure

The 9 V battery bay is designed for hand installation, but, when they are new, it can be difficult to do until they are broken in. Therefore, we recommend the following procedure until you can access the battery bay easily with your fingers:

- 1) Place a small screw driver into battery bay door as shown. Gently push the blade at least 1/8" in.

- 2) Gently pry the bay door open.

3) Swing the bay door open until it clicks into the open position.

4) Open locking clip.

- 5) Slide the 9 V battery in with terminals in first, positive terminal closest to the outside (left side in picture).

- 6) Close locking clip. Push battery bay back to the closed position.
